

Reacti – Vision / Summary

Reacti is a next-gen messaging app designed to bring real emotion back to digital conversations. At its core, it transforms how people communicate by automatically capturing the **live reaction** of the receiver (via front camera video) *the moment they open a message*. This spontaneous video reaction is then instantly sent back to the sender, creating a loop of authentic human connection that text, voice notes, or emojis can't match.

What Reacti Does

Every time a user opens a message (text, image, or video), their front-facing camera records their immediate reaction—automatically, with no input required. That short selfie video is then sent back to the sender. The result is a new form of messaging that's **visual, honest, and deeply human**.

Core Vision & Functionality

- **Real-Time Reactions:** Every time a user opens a message (text, image, or video), their front camera is triggered automatically, recording a short selfie video reaction.
- **Automatic Capture & Return:** The reaction is seamlessly uploaded and returned to the sender without any user effort – no button press, no delay.
- **Message-Reaction Threads:** Conversations become a chain of messages and reactions, offering a richer, more expressive form of communication.
- **Mobile-first Design:** Built for iOS/ Android, Reacti is fast, minimal, and immersive, emphasizing experience over clutter.

Unique IP & Patent-Protected Features

Reacti is patent-pending. The core intellectual property revolves around the **automated capture and transmission of user reactions tied to message access**. To preserve the uniqueness and patent strength of Reacti, the following elements are essential:

1. **Automatic Triggering of Front Camera**
 - The system uses message-open events as the trigger for automatic recording from the front camera.
2. **Background Recording Without UI Obstruction**
 - The reaction is recorded while allowing the receiver to view the message, preserving

context and creating a genuine response.

3. **Reaction Auto-Send Mechanism**

– Once recorded, reactions are sent without manual approval, maintaining the app's raw and authentic tone.

4. **Synchronous Messaging-Reaction Model**

– The conversation structure is uniquely designed as sender → message → auto reaction → back to sender, in a closed loop.

5. **No Filters, Edits, or Replays for Receiver**

– To preserve emotional honesty and the IP's authenticity principles, the receiver cannot preview, edit, or retry reactions.

This approach creates a moat around the experience—a **messaging loop that cannot be easily replicated by existing platforms like WhatsApp, Snapchat, or Instagram**, all of which rely on manual, staged replies.

Why It Matters / Why Now

Social media has made communication feel staged—filtered, polished, and performative. **Reacti flips that.** By automatically capturing real-time reactions the moment a message is opened, it brings back authenticity, intimacy, and emotion to digital connection.

Whether it's:

- Friends sharing a joke and wanting to see the real laugh,
- Parents witnessing their child's reaction to a surprise,
- Grandparents seeing first steps from across the world,
- Or creators responding to fans in a deeply personal way—

Reacti makes conversations feel real again.

Younger generations are already turning away from curated content. They want **vulnerability, truth, and emotional presence**. Reacti delivers it—at exactly the right time.
